

# Offshore Wind Energy at the Atmospheric Sciences Research Center

Renewable Energy Group

Jeff Freedman, Scott Miller, Elizabeth McCabe,  
Patrick Miller, and David Marcial

Research includes (but is not limited to):

1. Effects of climate change on offshore wind
2. Model development optimized to capture offshore wind mesoscale phenomena (e.g., sea breeze, cold water upwelling, wakes)
3. Analysis of extreme conditions (ramps, droughts, tropical and extra-tropical system) and lightning
4. Instrument development (buoy-based flux measurements—WFIP3)

# Reducing Errors in Offshore Wind Forecasting during Peak Demand

Elizabeth McCabe—presented at NAWEA (2024)

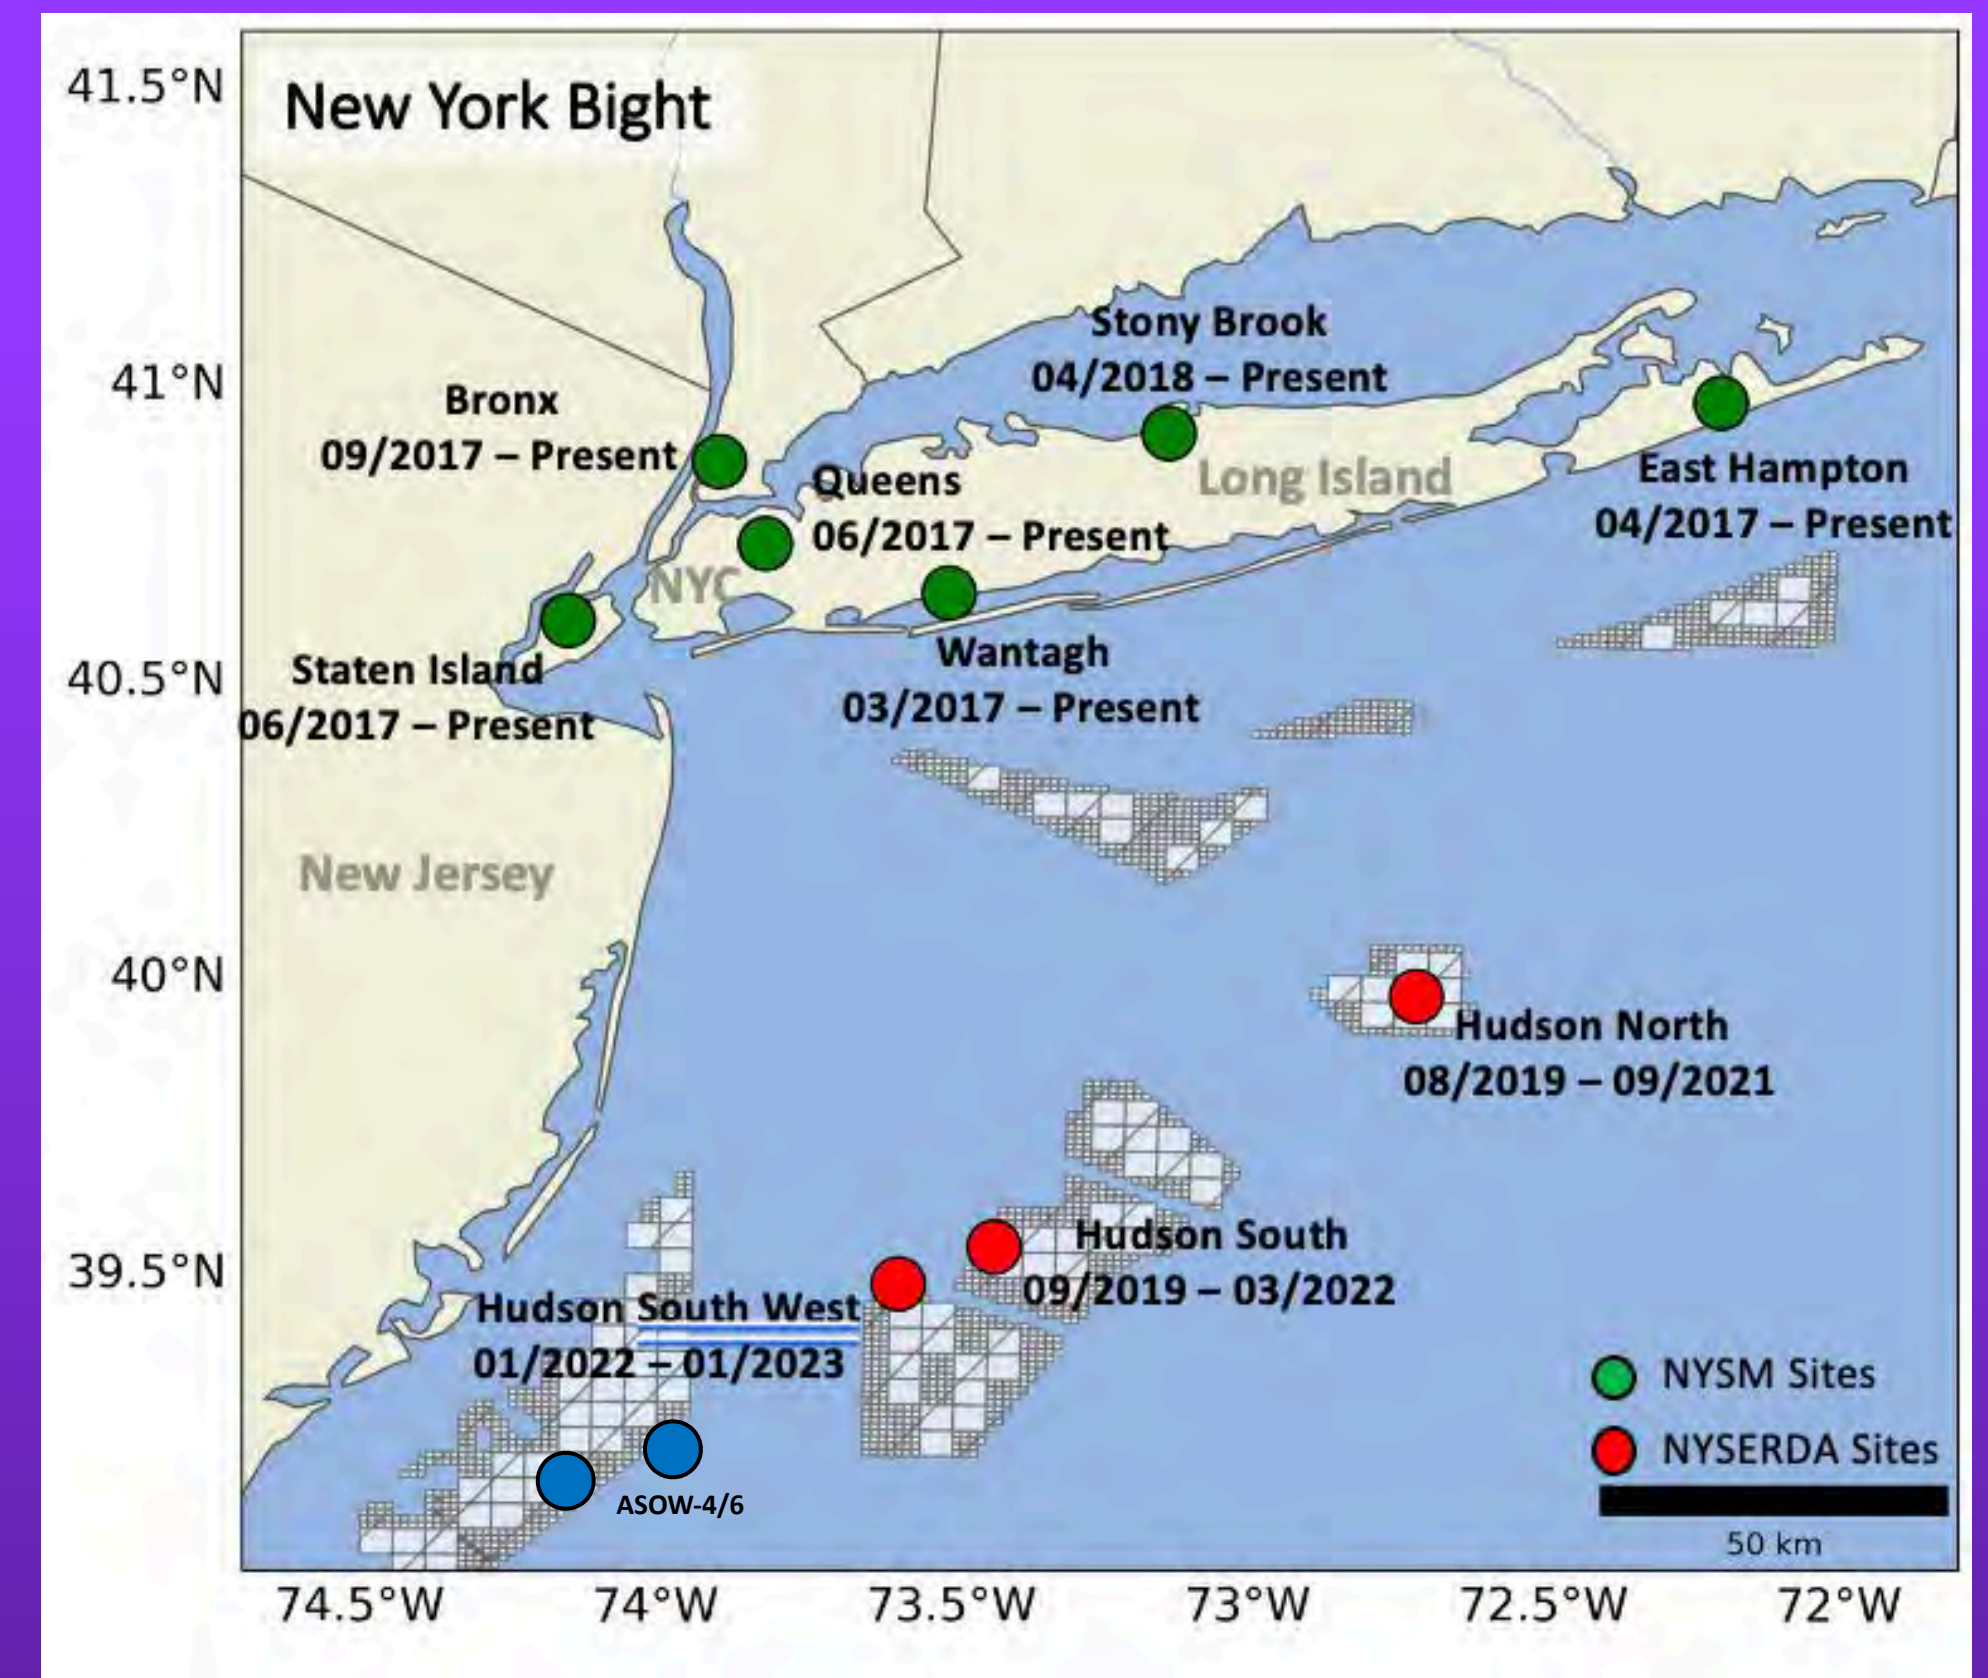

## PROBLEM:

Warm season SEA BREEZE and Low-Level Jet (LLJ) is important for offshore wind energy development –

Circulation increases afternoon wind speeds and cools air temperatures when energy demand is high

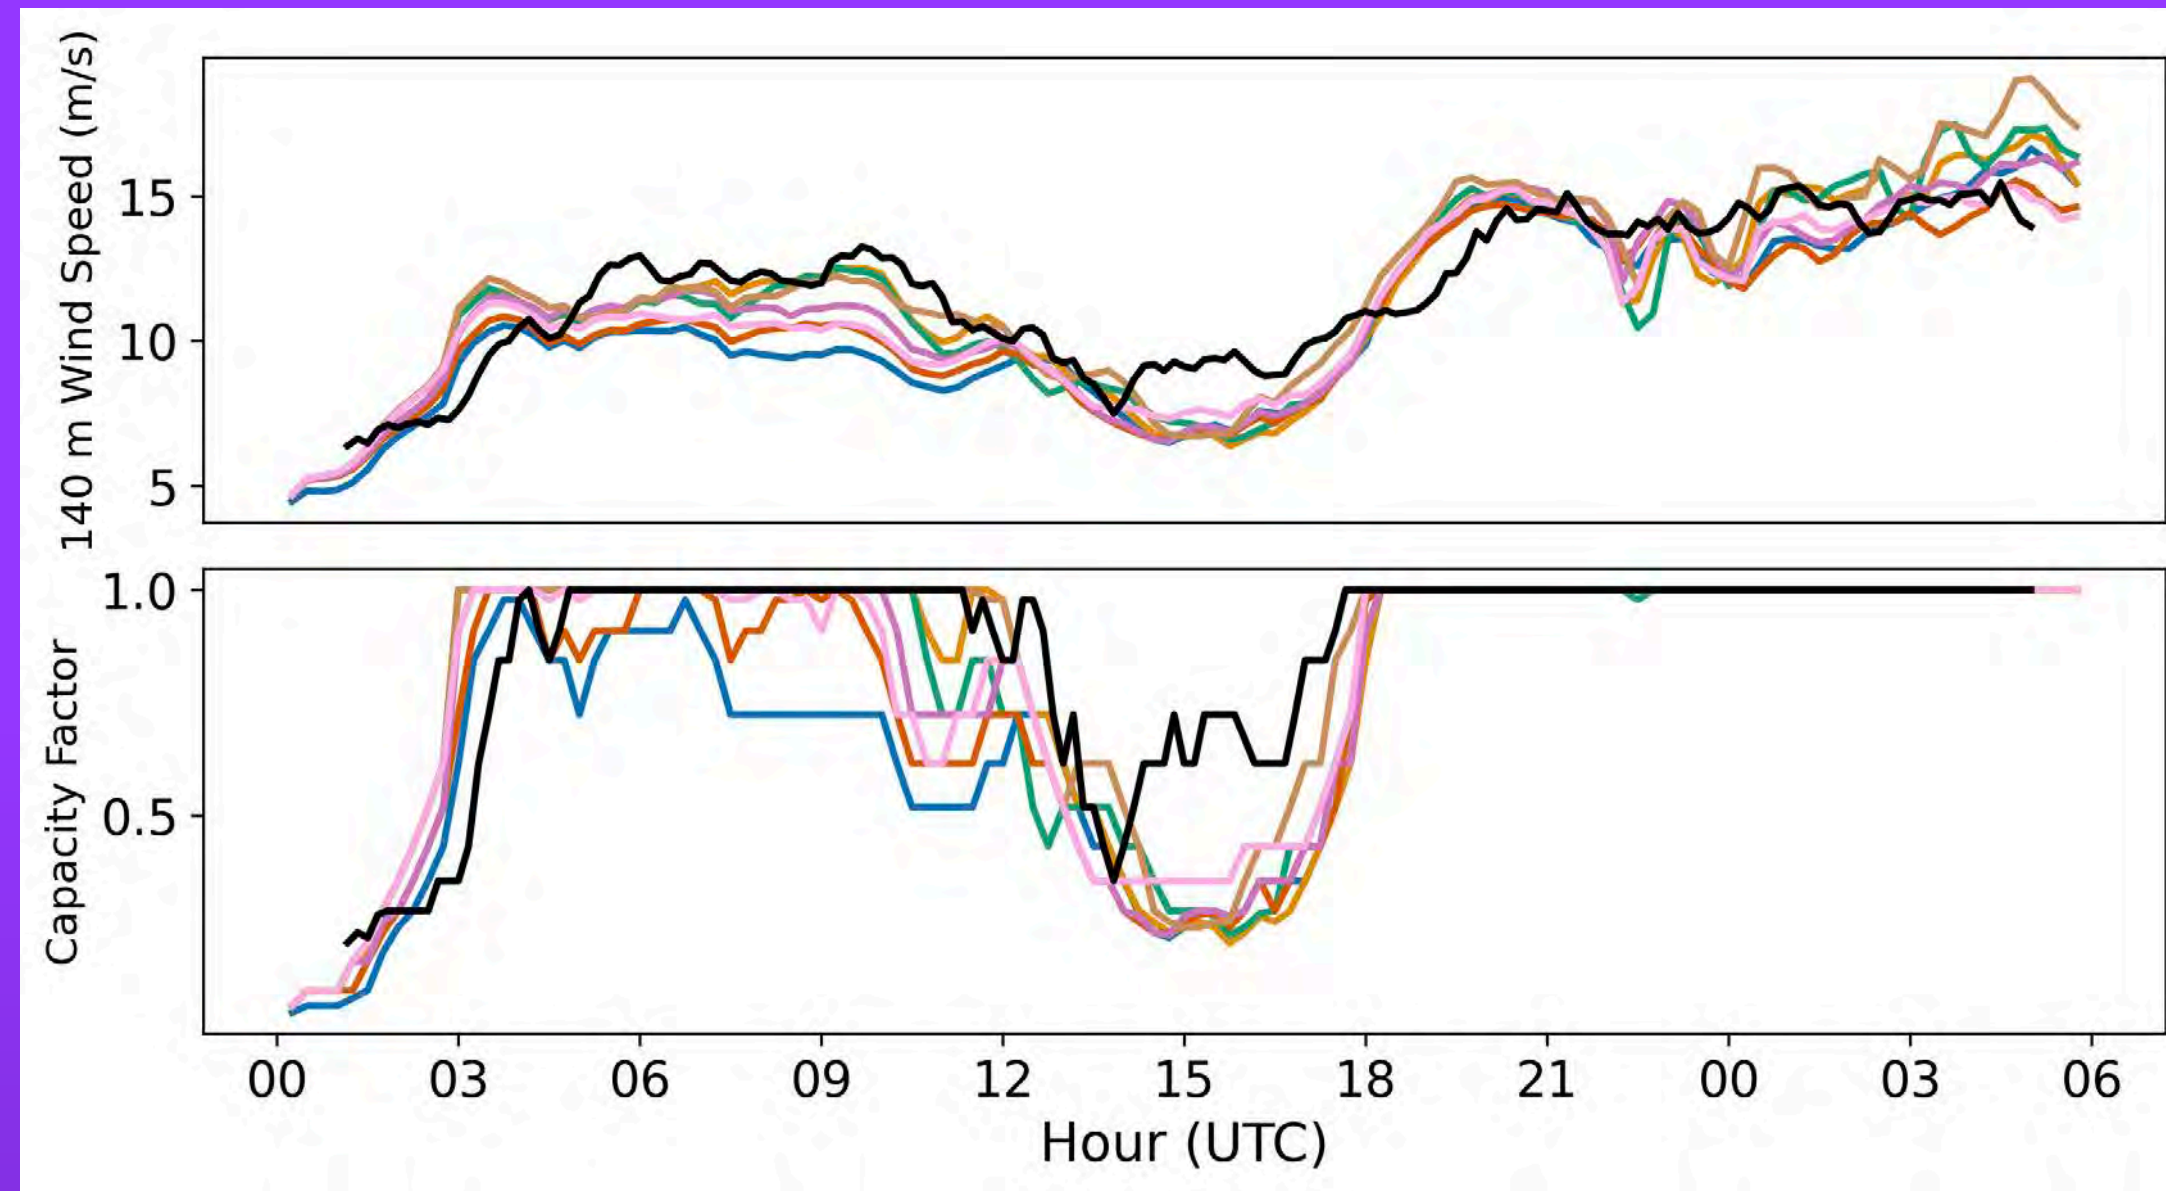

OBJECTIVE: REDUCE RISK in power production forecasts by determining the best model setup for the sea breeze and LLJ in the New York Bight

→ Test 18 different model combinations

Limited measurements in offshore and coastal regions means that we must rely on models

# HUDSON SOUTH

# HUDSON NORTH

Largest model errors in the hours prior to and during sea breeze onset (~ 10 AM to 2 PM LT)  
 Models underestimate wind speed = good error for utilities!

Models and observations at 100% capacity during sea breeze

**The Winner: The Mellor-Yamada-Janjic (MYJ) planetary boundary layer scheme is best suited for the NYB under sea breeze and LLJ conditions.**

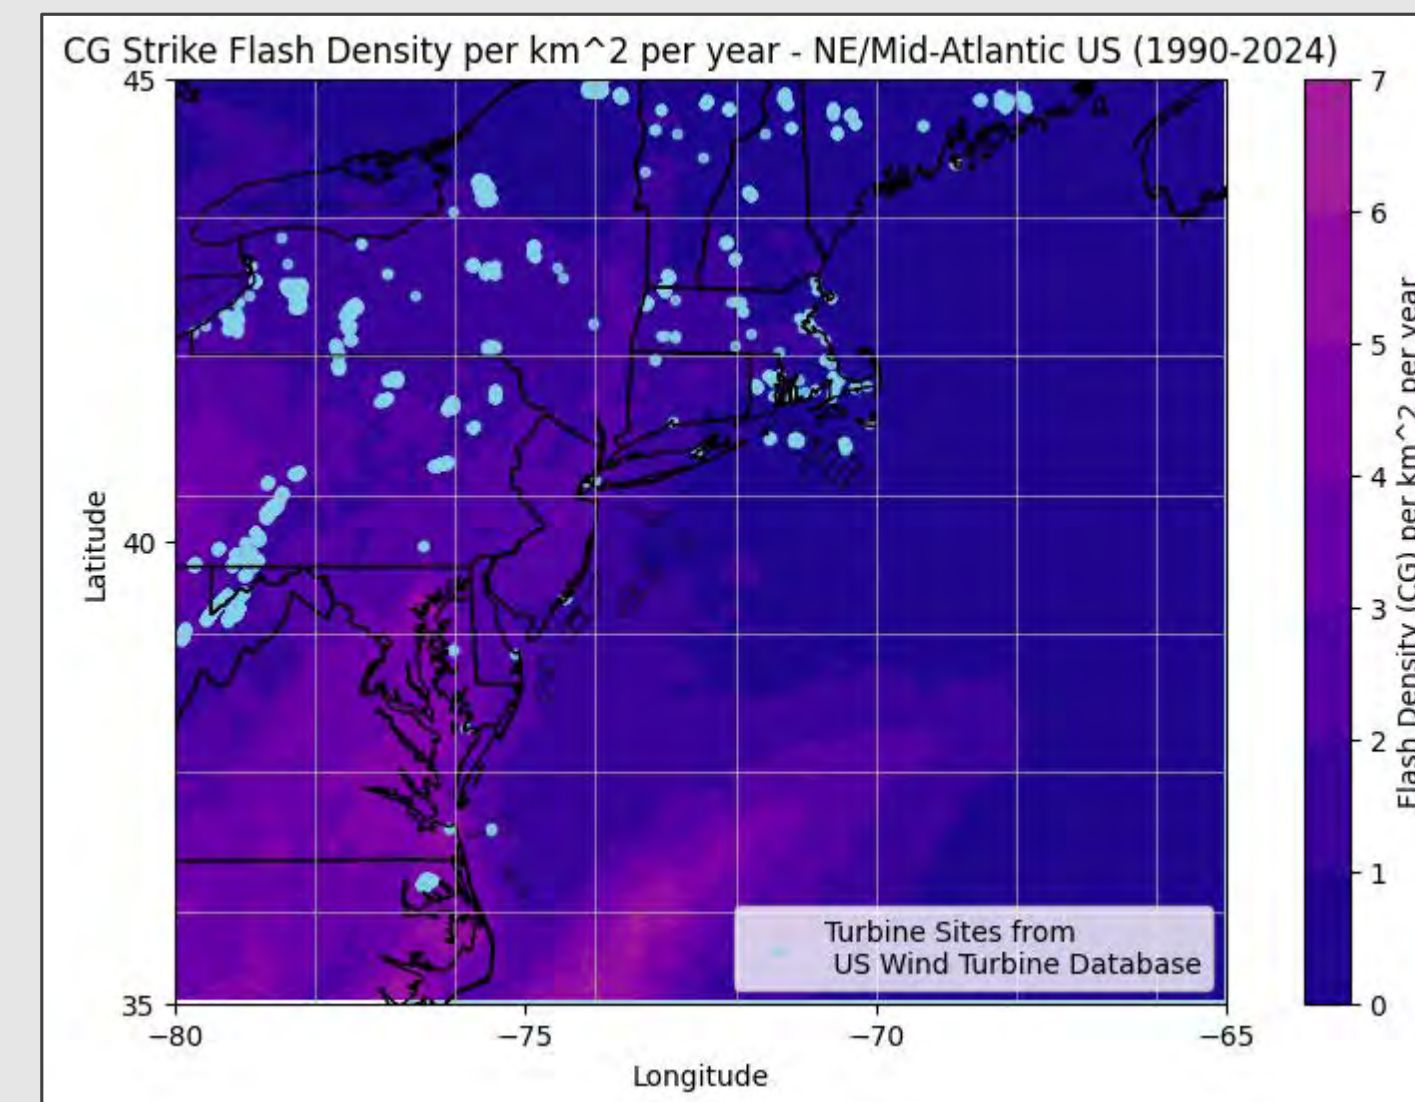

**See McCabe, E., and J. M. Freedman, 2024:** Quantifying the uncertainty in the Weather Research and Forecasting Model under sea breeze and low-level jet conditions: Importance to offshore wind energy. Accepted Weather and Forecasting.  
**McCabe, E., and J. M. Freedman, 2023:** Development of an Objective Methodology for Identifying the Sea Breeze Circulation and Associated Low-Level Jet in the New York Bight. Wea. Forecasting, 38, 571–589, <https://doi.org/10.1175/WAF-D-22-0119.1>.

**Understanding model limitations and improving model forecast error can help to REDUCE ERRORS in power production (capacity factor) forecasts under sea breeze and LLJ conditions. Models need to be “fine tuned” to the specific region and meteorological conditions for which we are using them to predict.**

# Development of a Lightning Climatology for Wind Farms in the Eastern United States: Focus on the New York Bight and Upstate NY

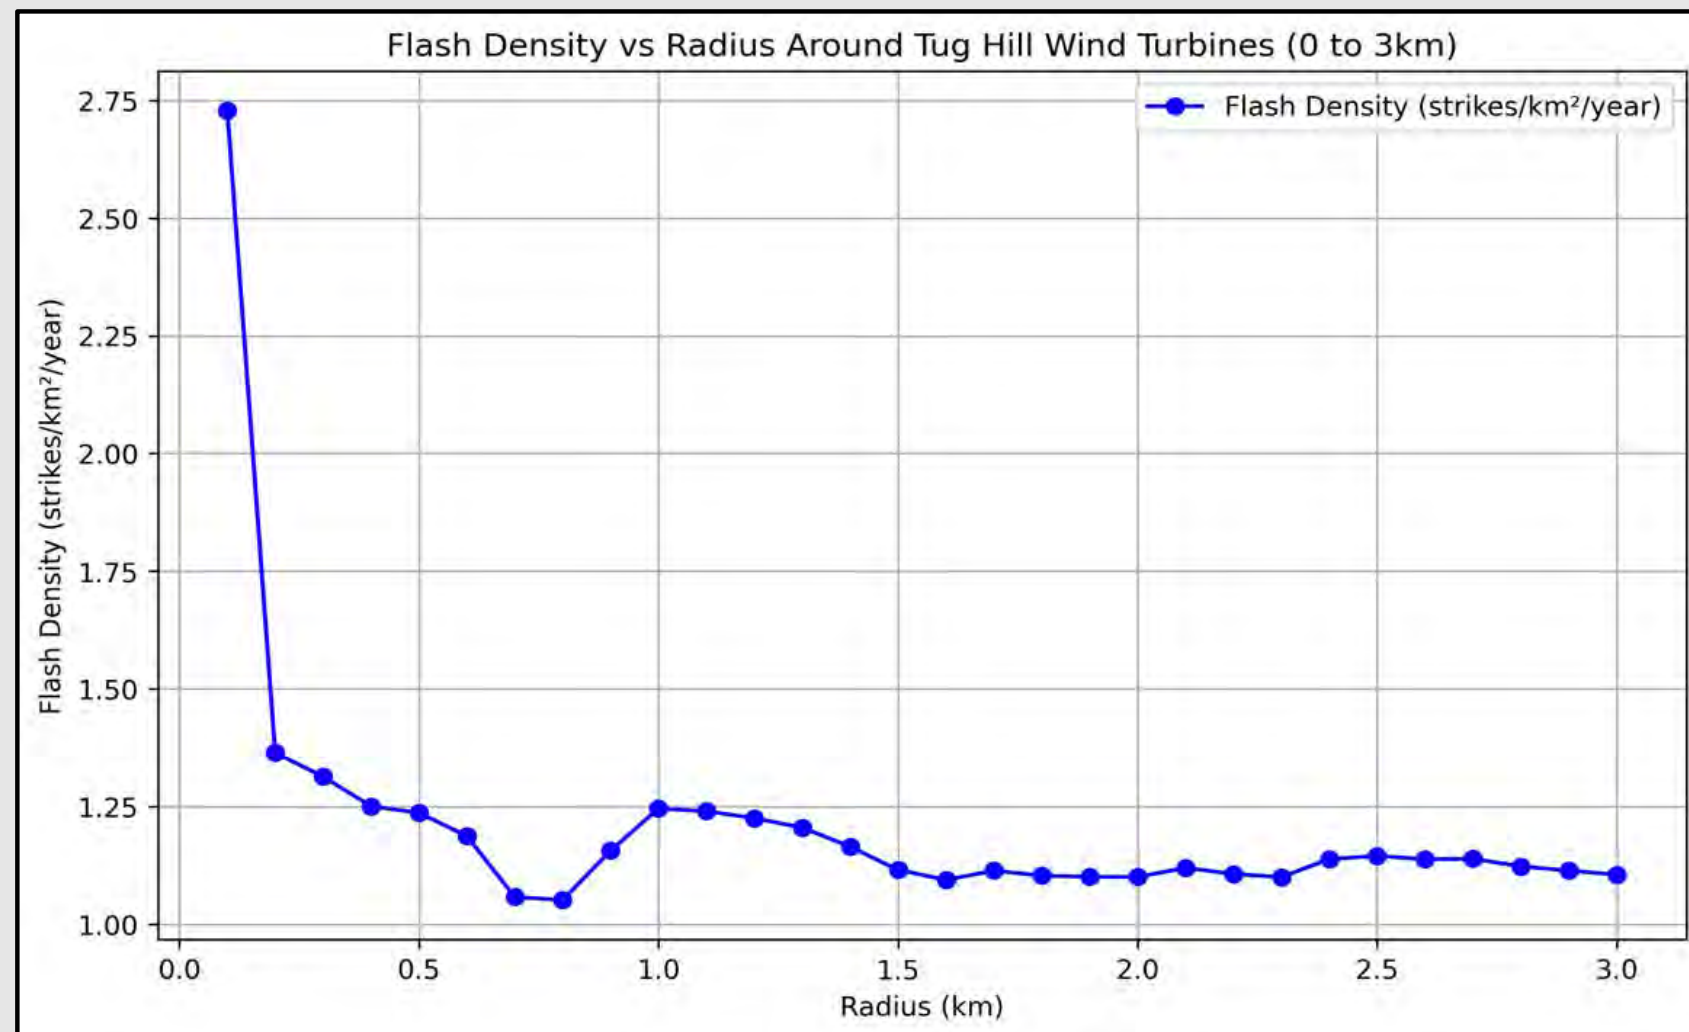

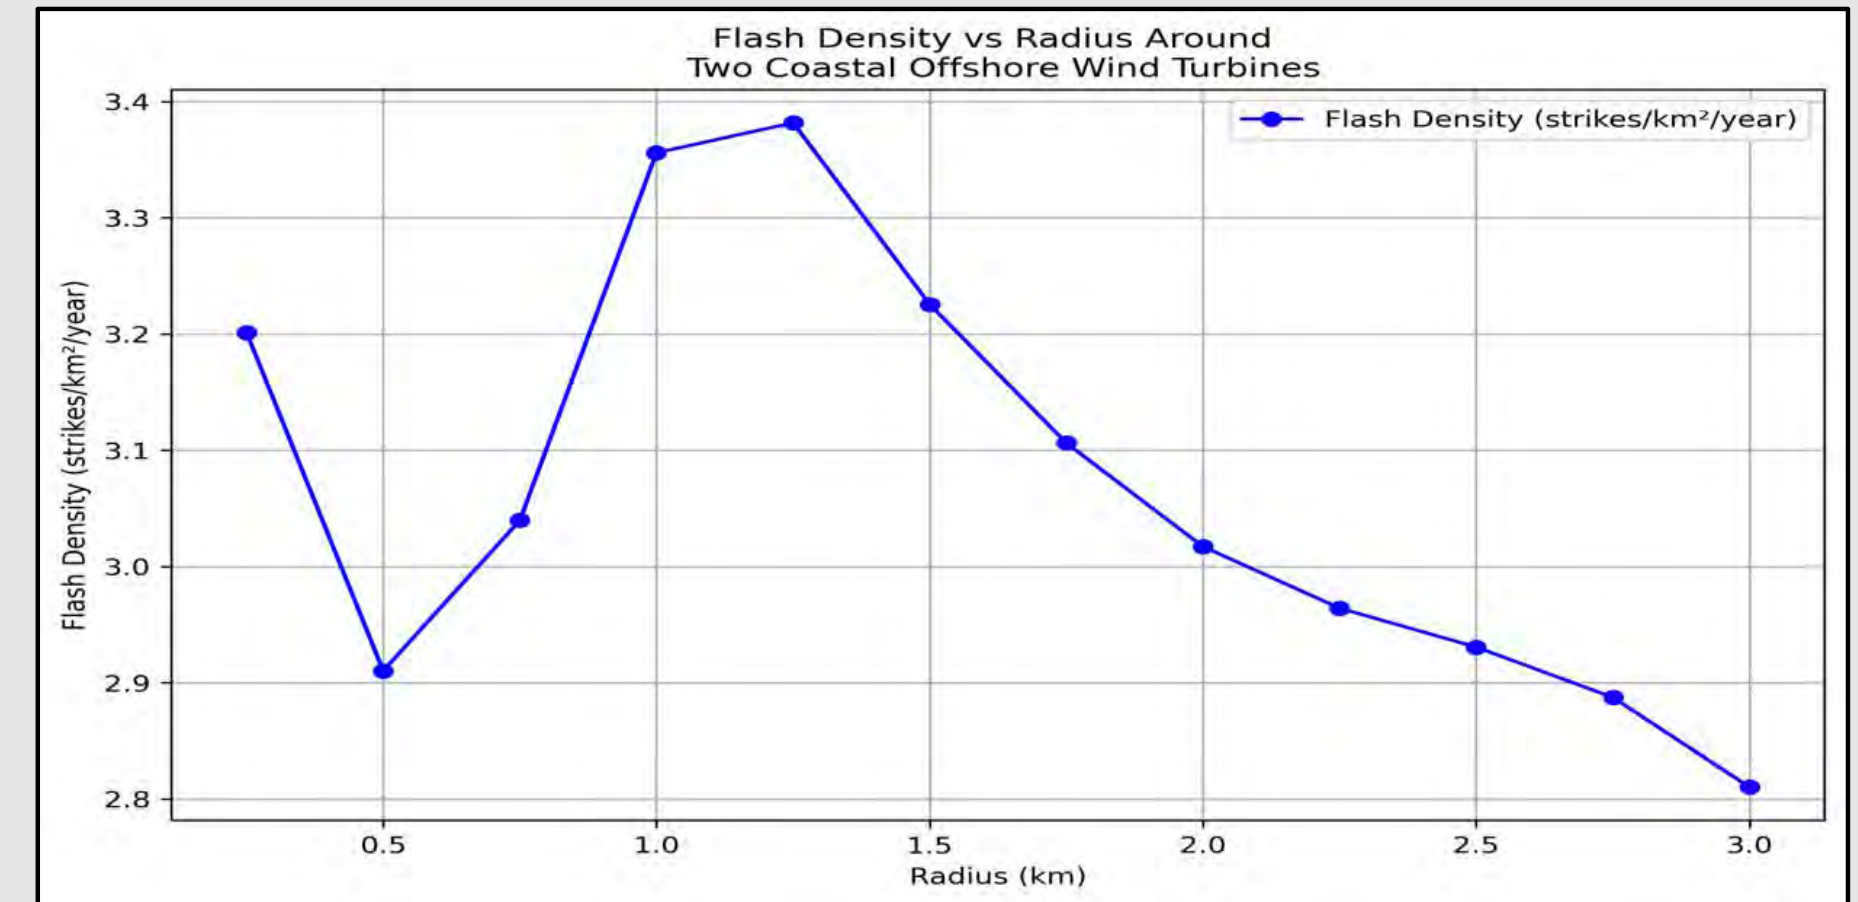

Presented by Patrick Miller at the 105<sup>th</sup> Annual American Meteorological Society (AMS) Meeting New Orleans, LA | 13 January 2025

## EASTERN US CG STRIKE FLASH DENSITY

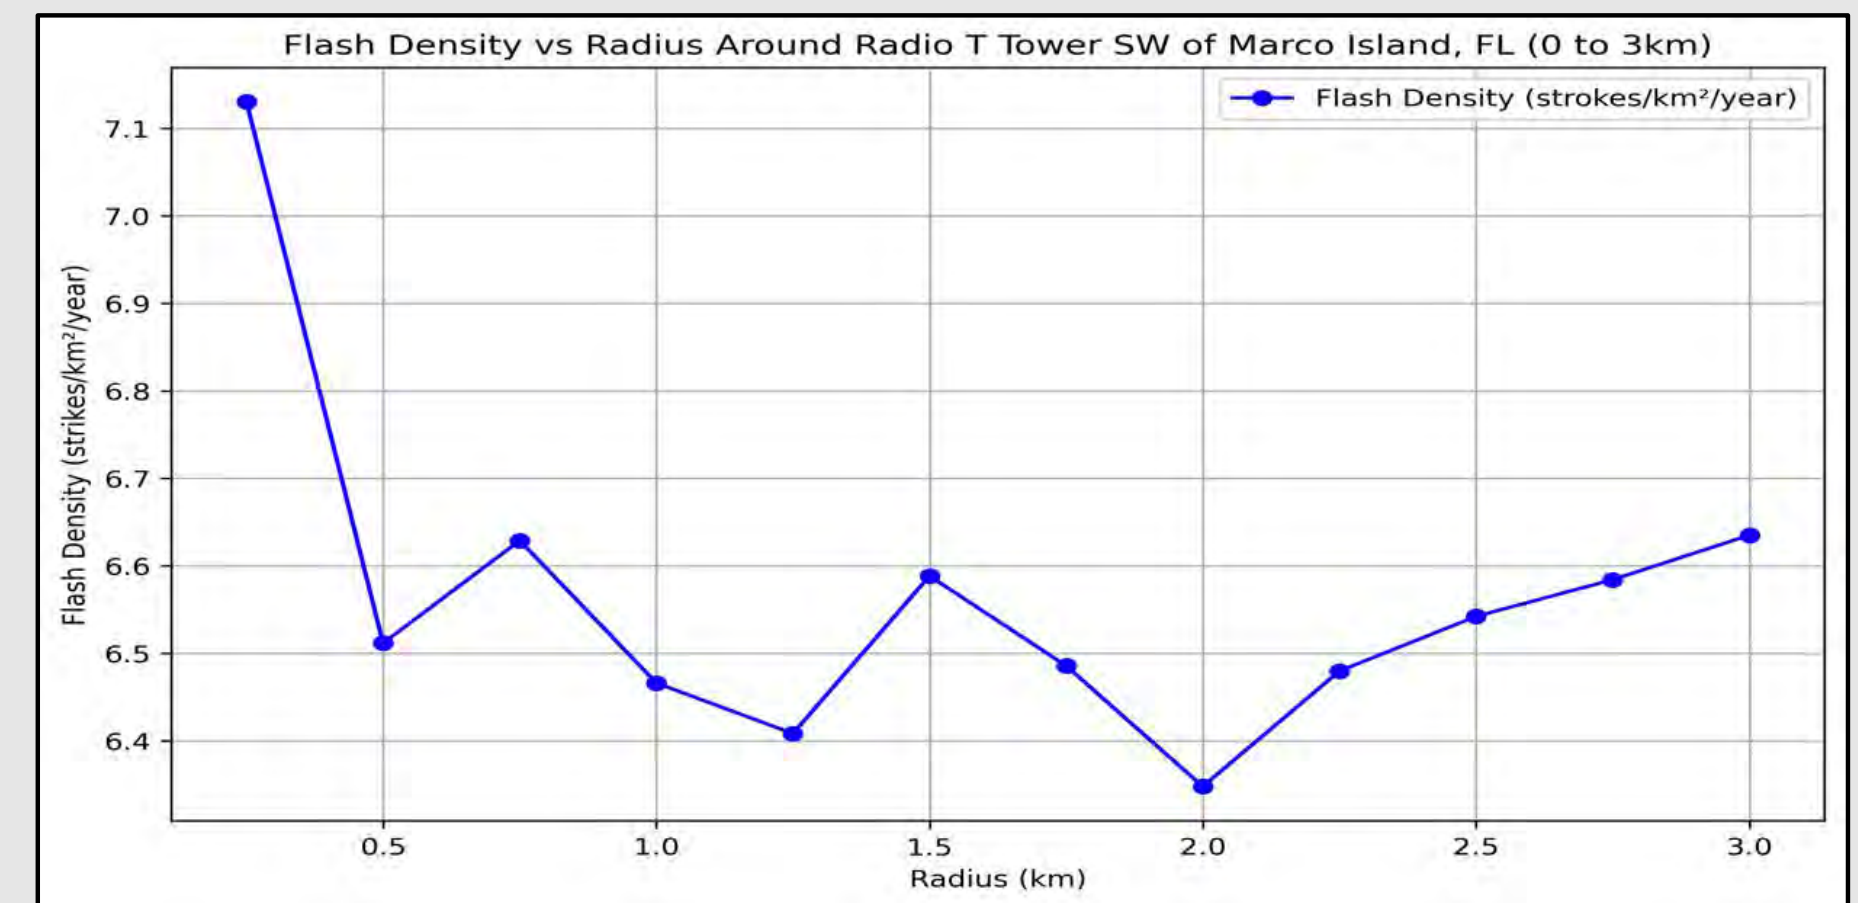

Slight variability from SW to  
NE across Mid-Atlantic and  
NYB

# TURBINES AND TALL METAL TOWERS ATTRACTING LIGHTNING

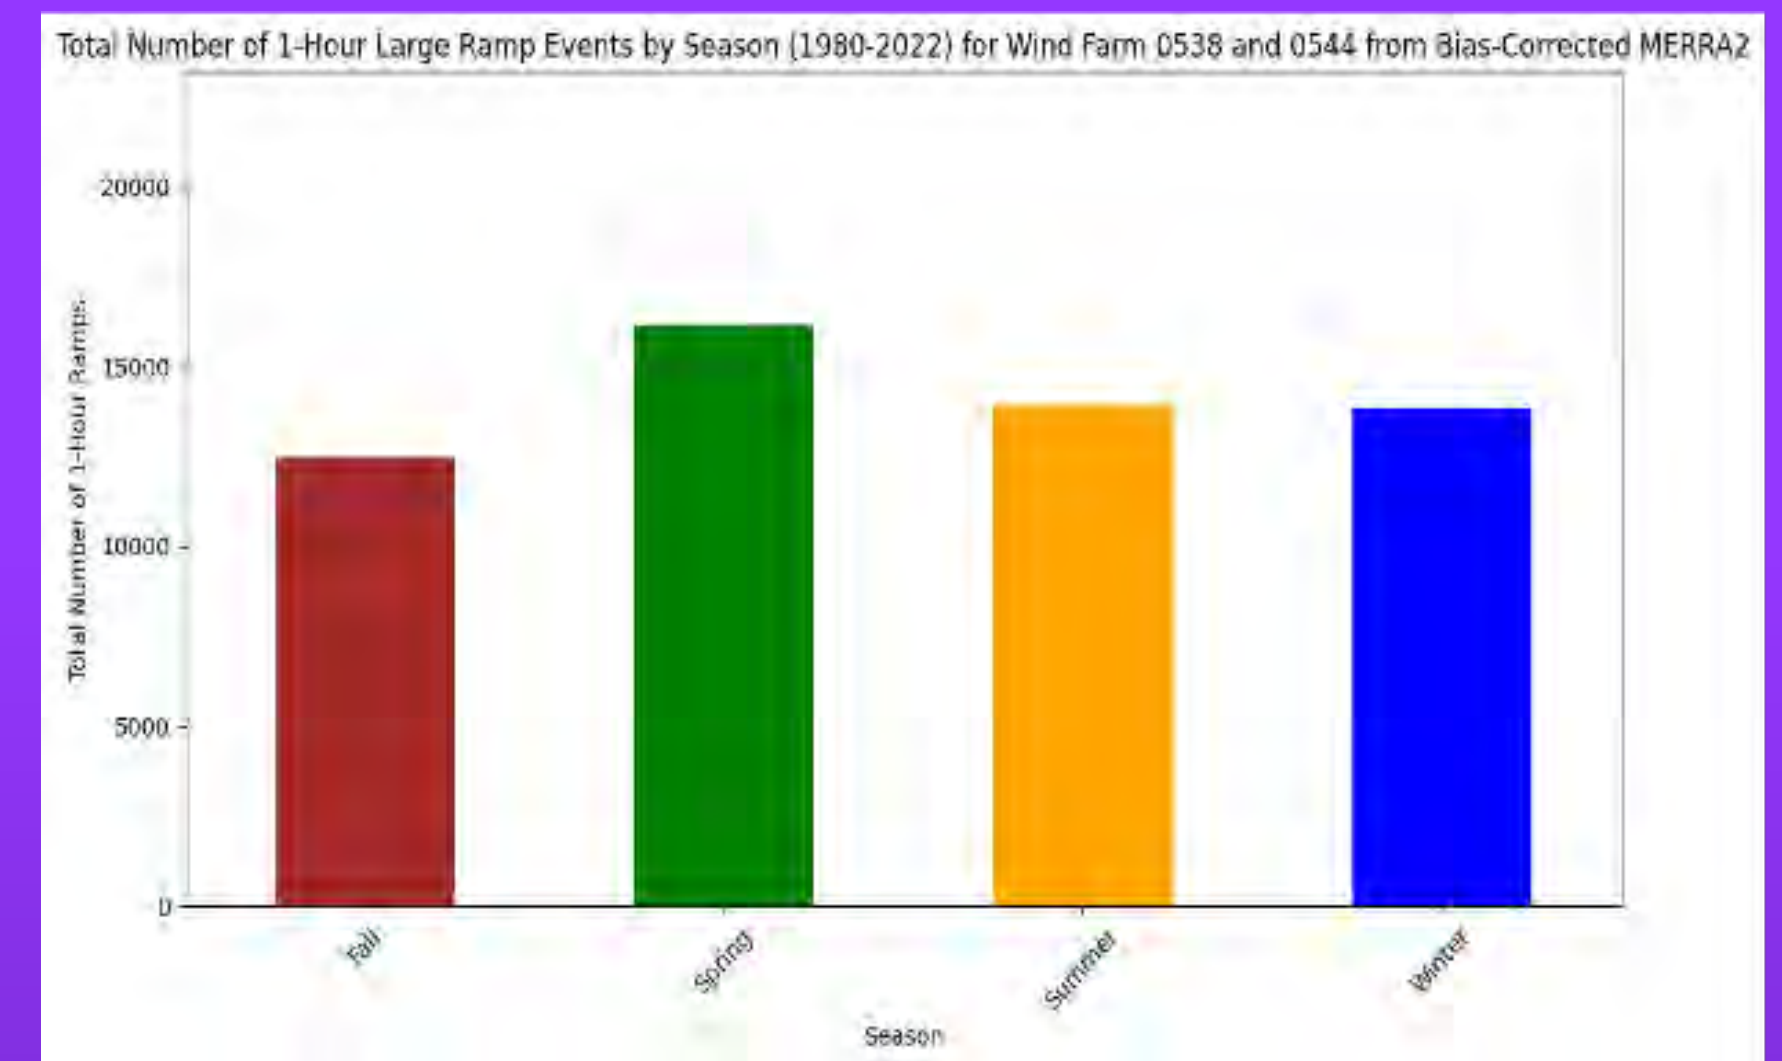

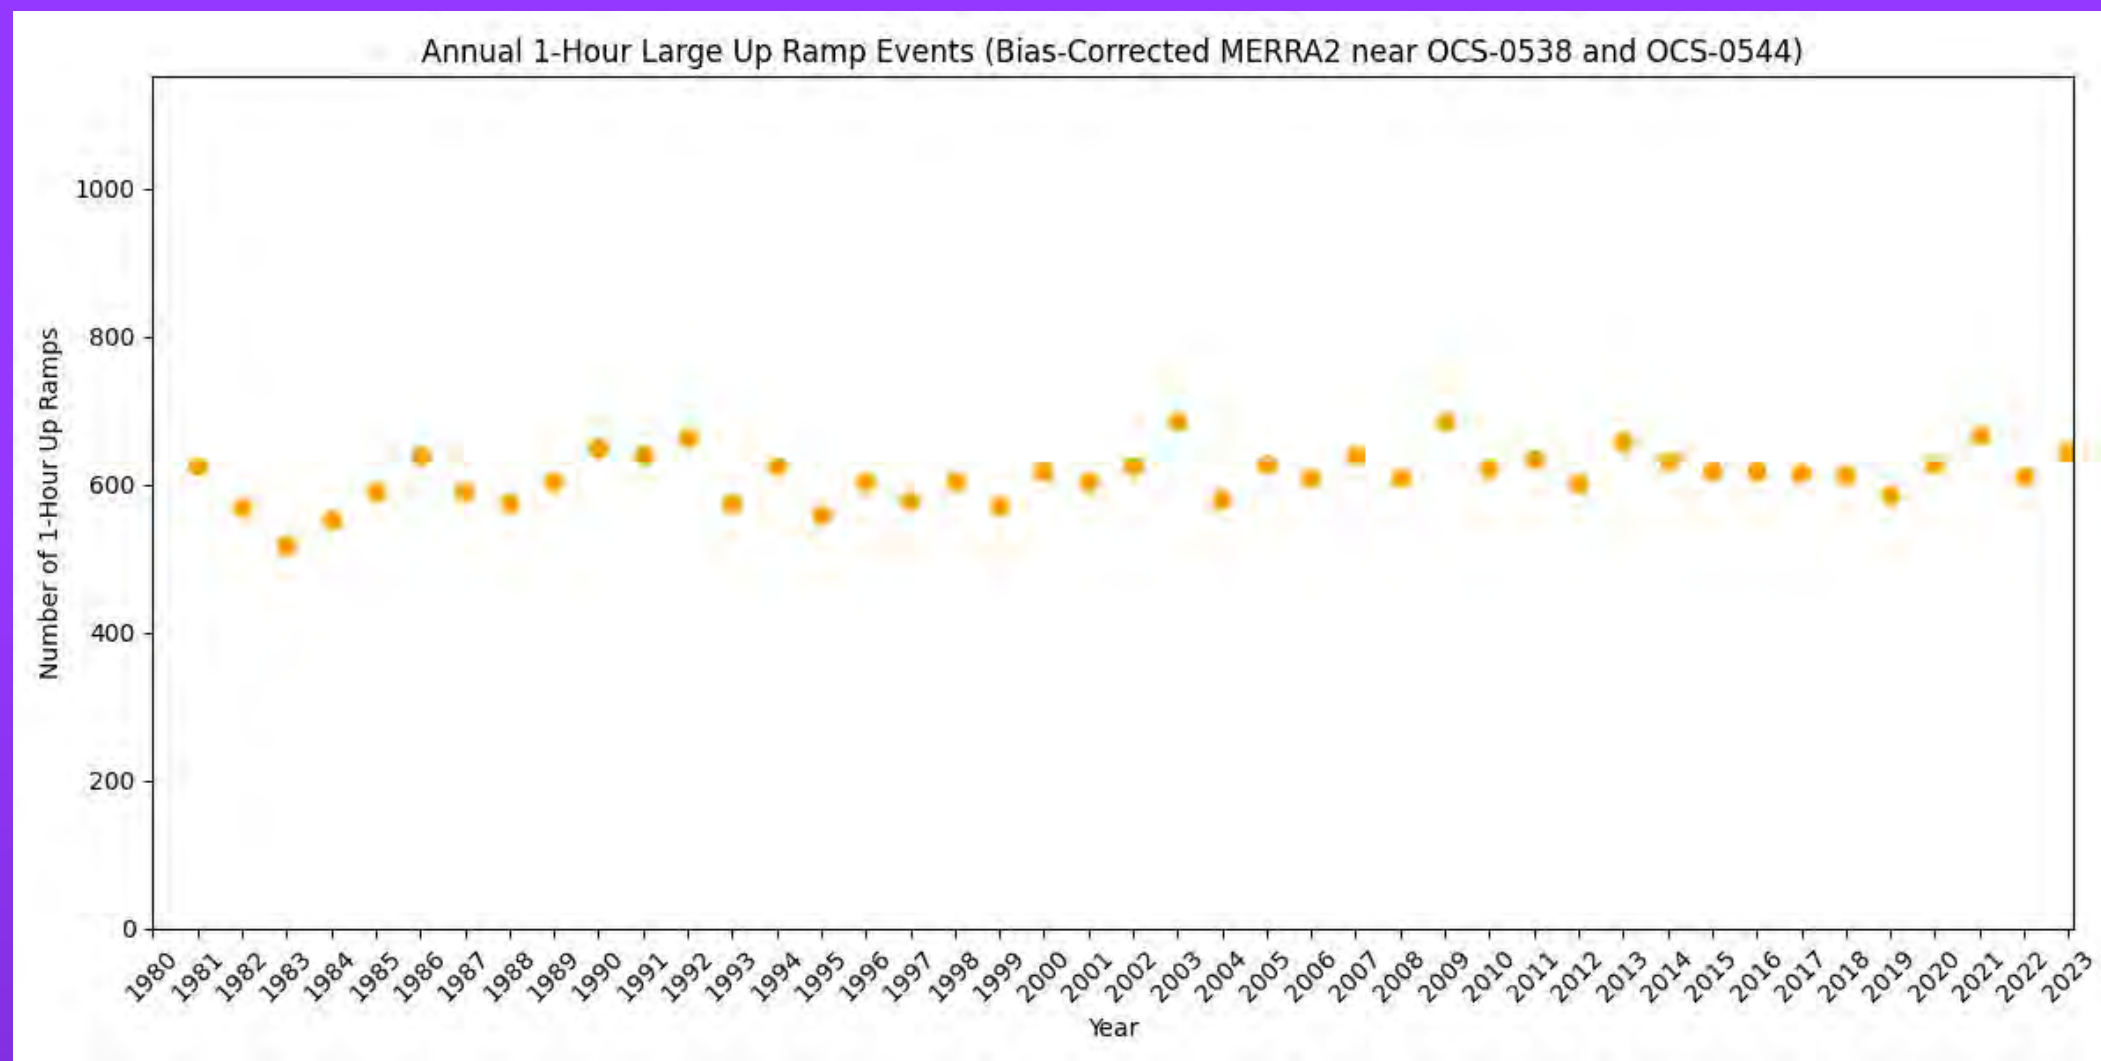

**Onshore locations have radii every 0.1 km, versus 0.25km for offshore.**

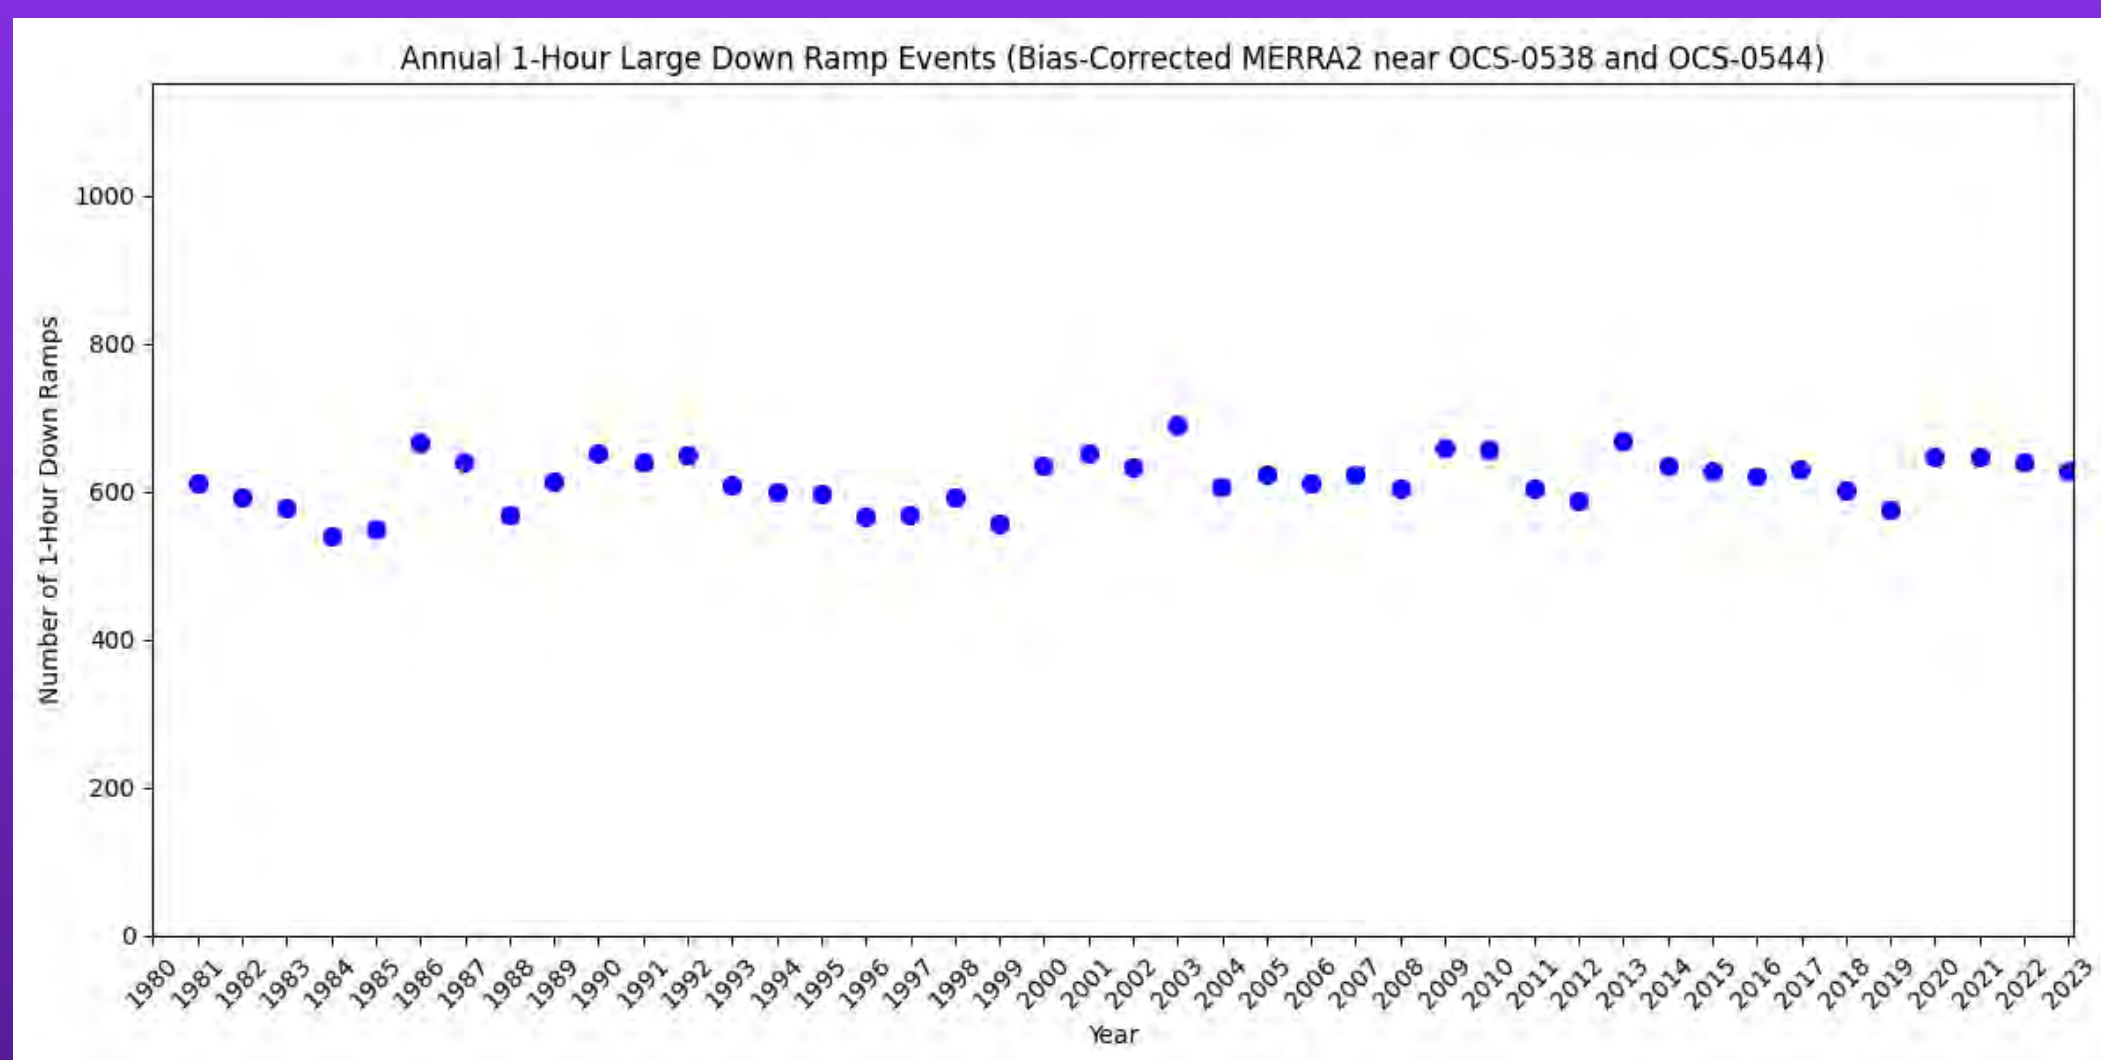

# 44-yr analysis of wind ramp events in the New York Bight

Patrick Miller

*A 1-hour large ramp is defined as a 10% change in relation to the 15MW rated capacity  
A 3-hour large ramp is defined as 20% change.*

*Wind speeds interpolated to 100 m and based upon to NREL's 15 MW wind power curve to estimate production.*

Surface fluxes => atmospheric stability => shape of ABL wind profile

# Evaluation of an Automated Eddy Covariance Air-Sea Flux Package on a Lidar Buoy

Surface fluxes => atmospheric stability => shape of ABL wind profile

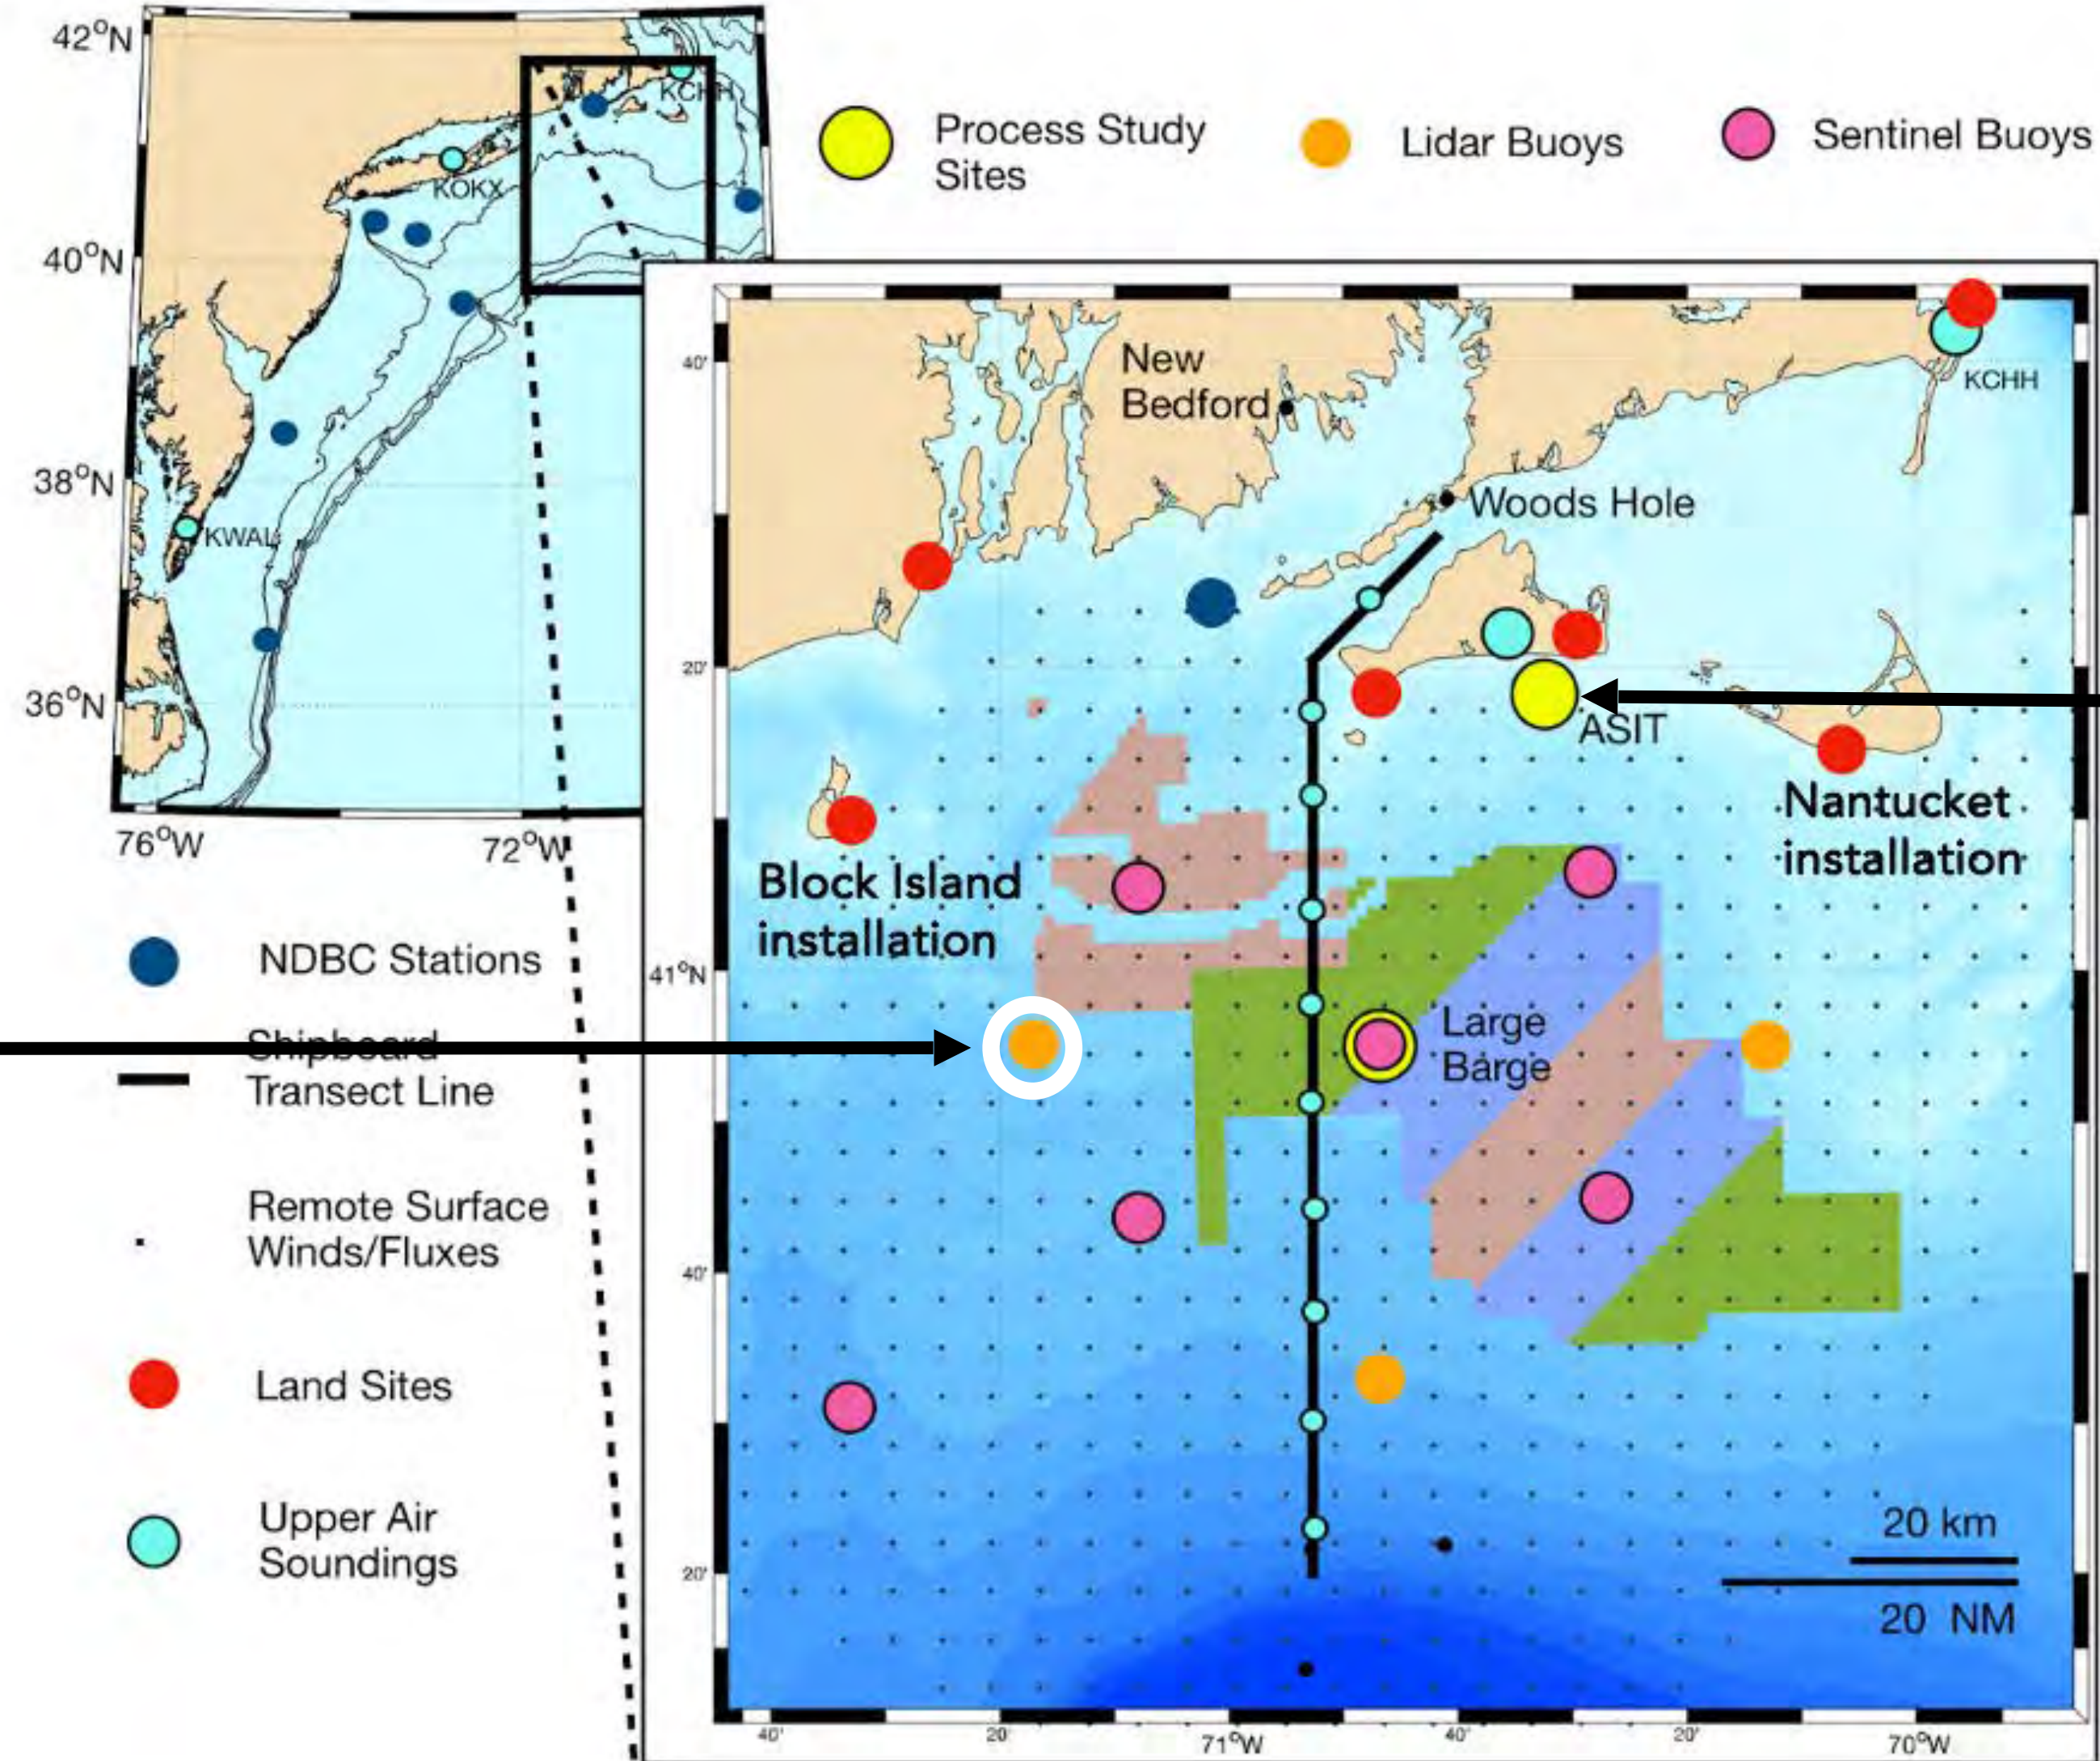

- “Flux-profile” relationships (e.g., Businger et al., 1971; Dyer, 1974) form backbone of surface, boundary layer parameterization schemes in weather models
- Do these relationships hold in coastal environments where offshore turbines are being sited?
- *In situ* fluxes and profiles are useful evaluation tools

David Marcial, Michael Jacques, Jason Covert, Matt Brooking, Janie Schwab, Kit Moore, Jeff Freedman, Scott Miller, Raghavendra Krishnamurthy\*  
Atmospheric Sciences Research Center, University at Albany, \*Pacific Northwest National Laboratory

Surface fluxes => atmospheric stability => shape of ABL wind profile

# Summary

- ~ 40,000 (and counting) 10-min fluxes that are *QC'd, motion-corrected, calculated onboard* and sent via satellite in *near real-time* from an *unattended* EC flux system

## Future work

- Continue evaluating heat and vapor fluxes
- Compare buoy fluxes to fixed ASIT tower
- Evaluate NOAA COARE bulk algorithm with EC fluxes
- Integrate fluxes with collocated lidar data to assess / refine / improve flux-profile relationships

# Effect of Cold-Water Coastal Upwelling on Sea Breeze and Low-Level Jet Enhancement, and its Relationship to Easing Loads in Urban Areas

ELIZABETH MCCABE AND JEFF FREEDMAN

ATMOSPHERIC SCIENCES RESEARCH CENTER,

UNIVERSITY OF ALBANY, STATE UNIVERSITY OF NEW YORK, ALBANY, NY, USA

AMS 105<sup>th</sup> Annual Meeting, New Orleans, LA

16<sup>th</sup> Conference on Weather, Climate, and the New Energy Economy

Load Forecasting in a Transitioning Energy Economy

Joint Paper 3.3

# Objective and Motivation

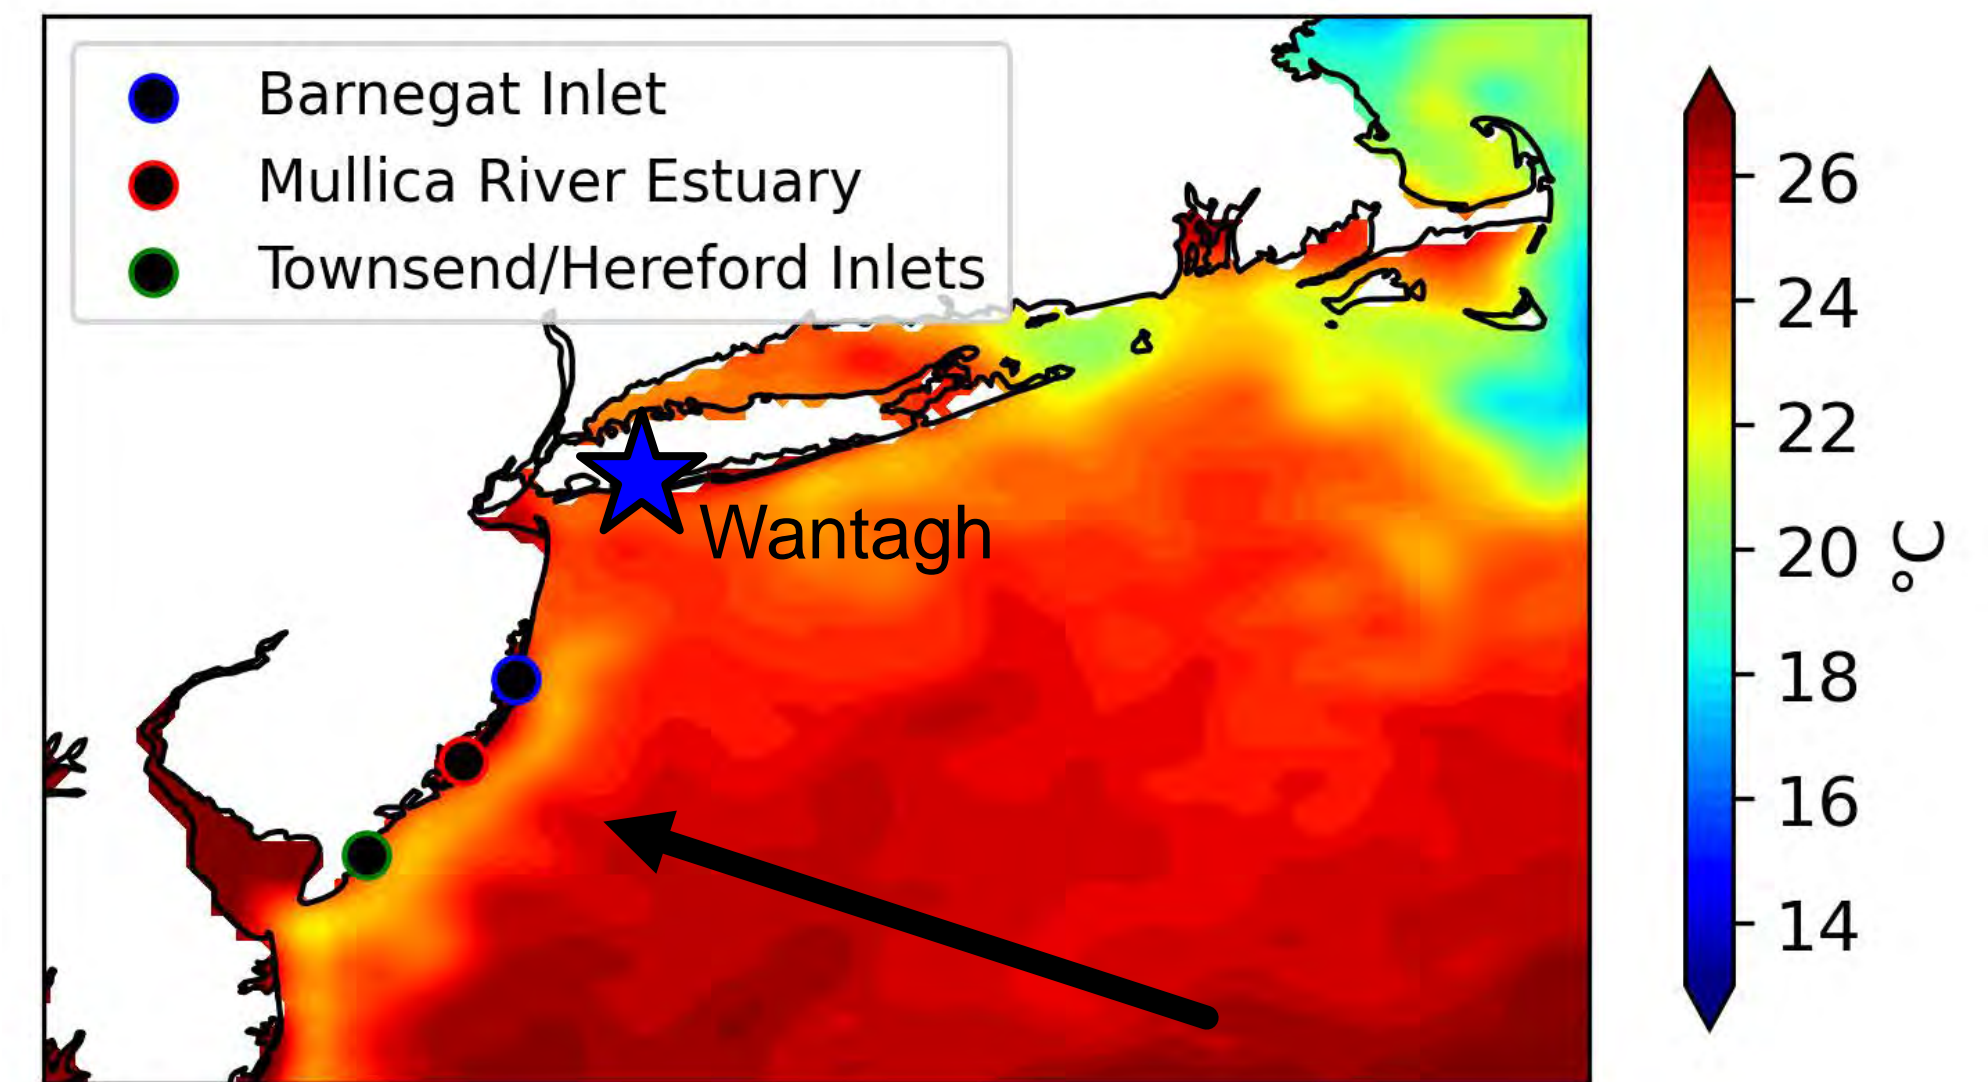

New York Bight is important region for offshore wind development!

Frequently experiences:

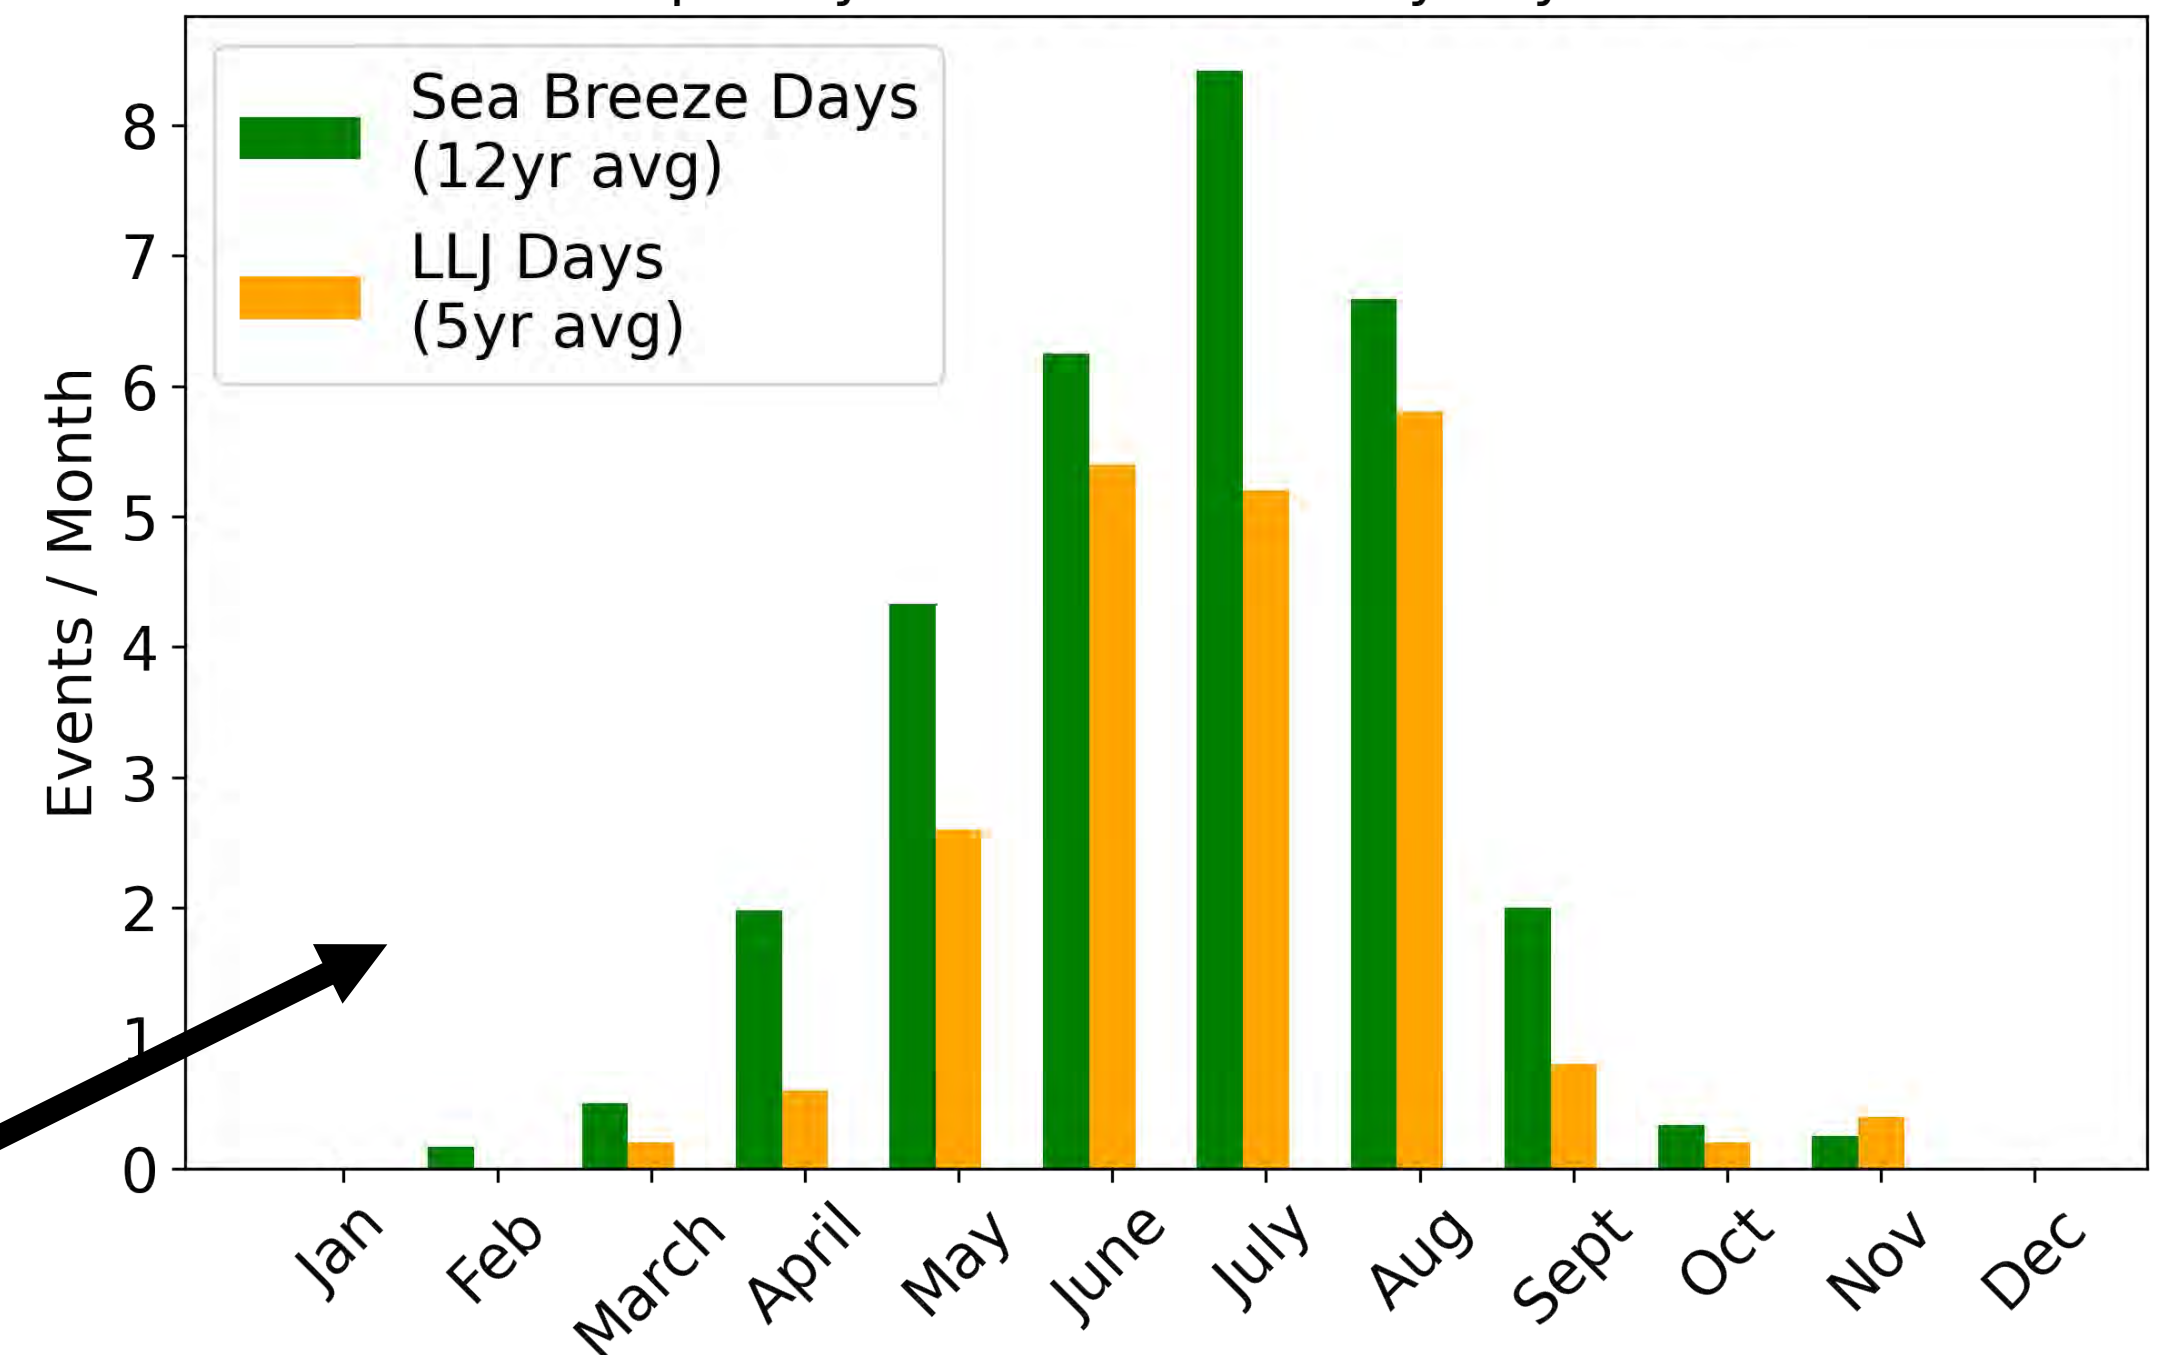

- Warm season **Sea Breeze** and **Low-Level Jet (LLJ)**  
*increasing windspeeds during times of peak load*
- Episodes of **Cold-Water Coastal Upwelling** especially along New Jersey coastline

Average of **31 Sea Breeze Days Annually** are identified at the **NYSM Wantagh** site, with more than **2/3 featuring an associated LLJ**  
*(LLJ = wind speed maximum between 150–300 m)*
